

**First Operation:** get list of all customers from Odoo table res\_partner using nestJS framework as middle where connector.

Request url : `http://ip:port/partner`

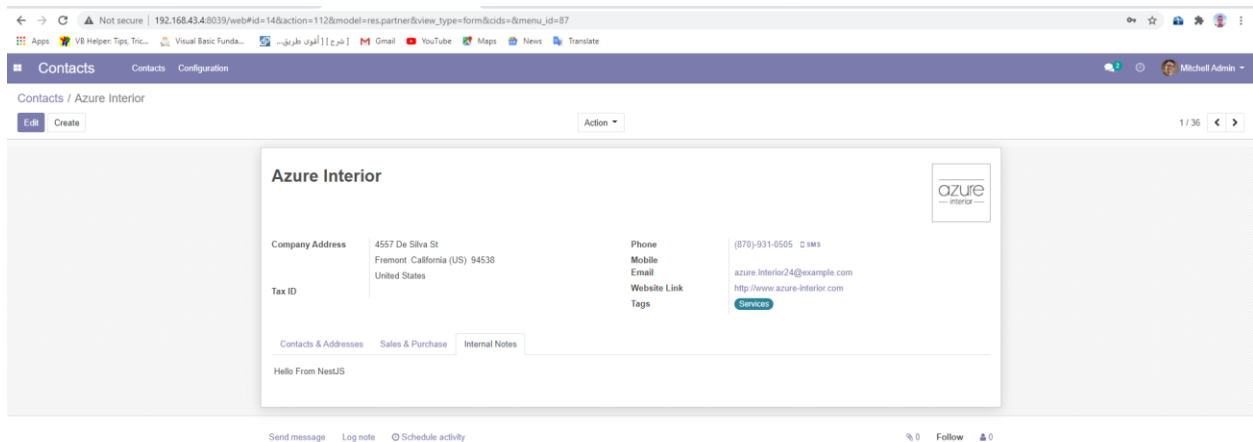

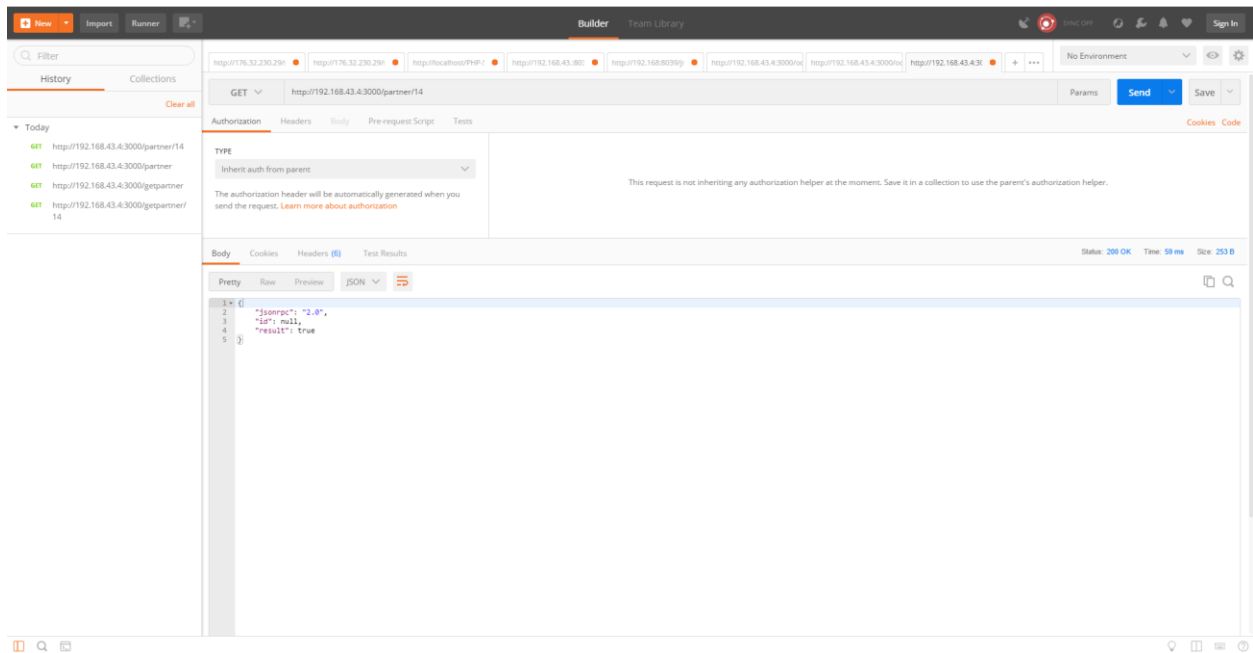

Expected results : list of all partners

**Second Operation:** update specific partner using nestJS framework as middle where.

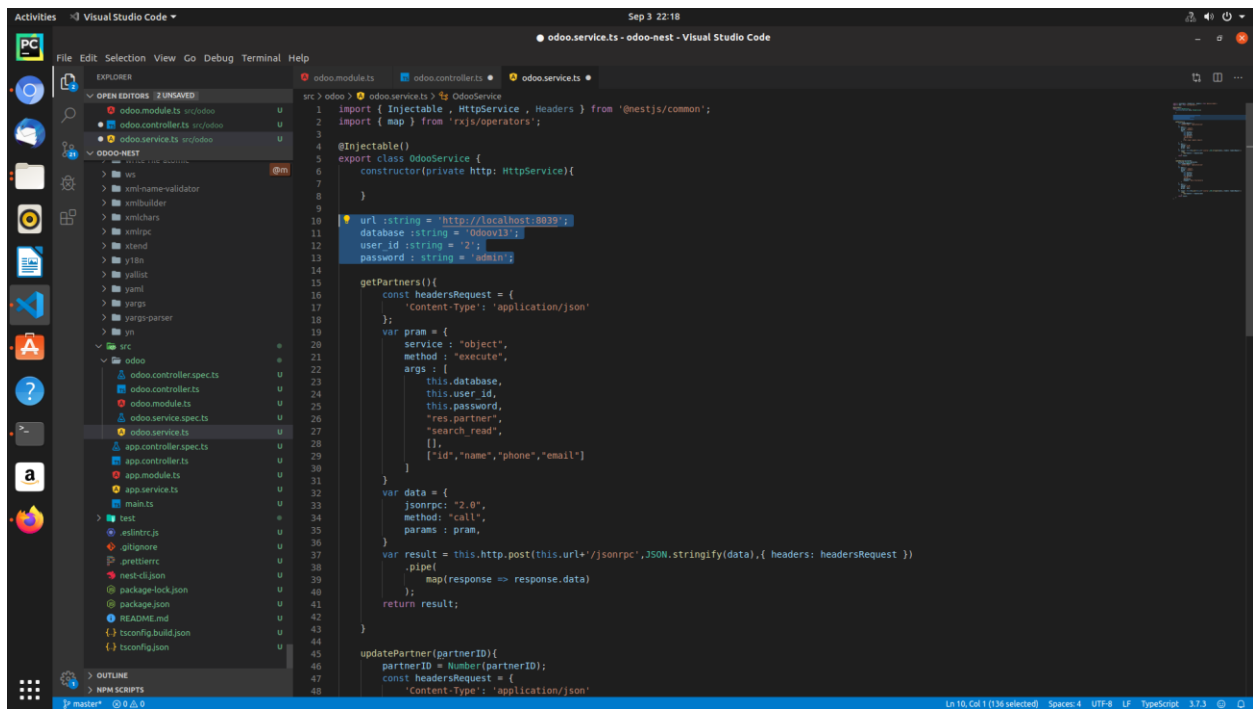

Request url : `http://ip:port/partner/partner_id`

Expected results : partner with this will be updated , there is field Internal Reference will be changed to 'Update from Nest JS' as follow :

Source Code will be attached,

Also you need to change the configuration parameter in file odoo.service.ts in order to test it with database and server you want

Best Regards
